

IMPACT® CTMS

Pulling it all together

Key features

- **Full featured CTMS providing trial planning, start-up, monitoring, financial administration, supplies tracking and investigator management functionalities**
- **Designed to handle large data volumes over a WAN (wide area network) with a large number of concurrent users**
- **Global deployment including international language and currency support**
- **Flexible monitoring tool, available both online and offline**
- **Advanced site selection capabilities including investigator profiling and search functionality based on historical trial performance**
- **Two-way link with Microsoft Project for sophisticated planning, tracking and rescheduling activities**
- **Seamless integration with ClinPhone® RTSM (Randomization and Trial Supply Management) and DataLabs® EDC for sharing of trial data**
- **Over 50 APIs (Application Program Interfaces) to enable automated data import from any clinical systems**

Key Benefits

- Single, centralized system containing all operational trial data
- Accurate and consistent information to facilitate timely and informed decision making
- Eliminates informational silos and promotes efficient cross-departmental processes resulting in accelerated drug development cycles
- Automated integration with RTSM and EDC eliminates need for re-keying data and discrepancy resolution
- Robust and proven solution with a track record of over 12 years and one of the largest installed CTMS user bases in more than 85 countries
- Highly configurable and adaptable to sponsor-specific workflow and terminology
- Active user community that provides input for product direction and promotes knowledge sharing among IMPACT® users

Value of a Single Centralized System

Clinical trials constitute the single most expensive component of the whole drug development process. In particular, clinical trial operations represent one of the most resource-intensive areas within a biopharmaceutical company and often involve tedious, manual processes for collecting, aggregating and rationalizing information from a wide variety of data sources. A CTMS yields immediate efficiencies and cost savings for clinical operations. How?

By providing a single, centralized system to orchestrate operational and administrative activities, a CTMS allows biopharmaceutical companies to intelligently manage the complexities of clinical trials. Instead of relying on disparate “islands” of information, often in direct conflict with each other, CTMS users benefit from sharing consistent trial data across the entire enterprise. This allows the sponsor organization to streamline processes, appropriately respond to current statuses and proactively manage their trials.

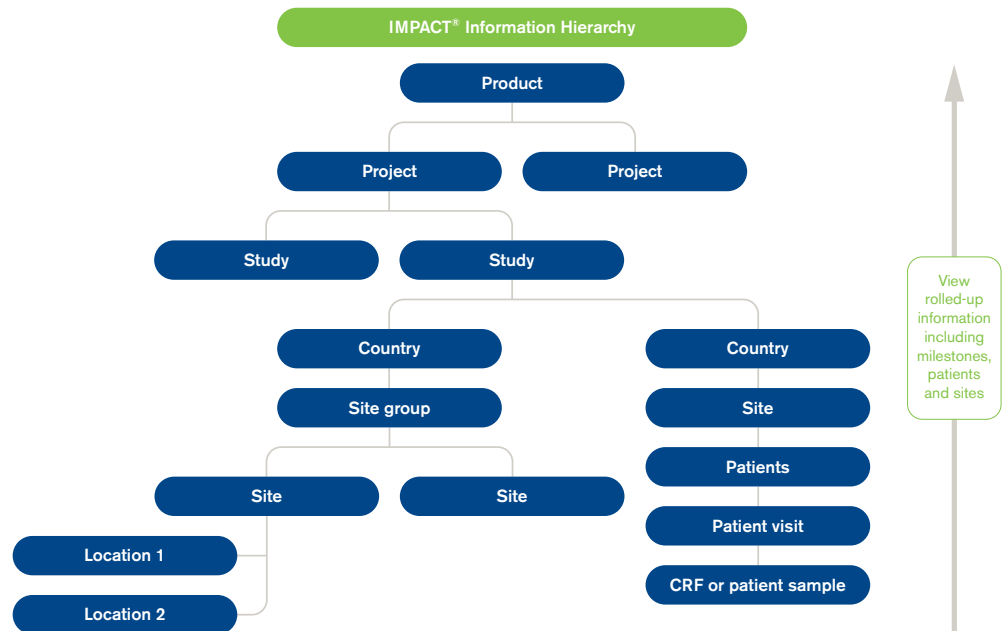

IMPACT® CTMS

IMPACT is a leading enterprise-wide CTMS used by many top global pharmaceutical companies to plan, administer and track every aspect of clinical trials. With one of the largest user bases, installations around the world and over 12 years of proven success, you are in the hands of true CTMS experts when you join the IMPACT community.

Making it Easier for You

IMPACT has been developed with flexibility and configurability in mind. The exceptional breadth of functionality has been designed to adapt to sponsor-specific workflows and terminologies. With IMPACT, clients do not have to modify their working practices and compromise with inflexible or rigid functionality. The system can manage trials of any complexity and support organizations of any size and global reach.

IMPACT has a large, global user organization—the IMPACT User Group (IUG). The IUG is an independent organization run by users for the benefit of the user community. It is a forum for exchanging knowledge on IMPACT usage and a direct channel for feeding back product needs and direction to

Perceptive Informatics. The IUG annually holds two formal, in-person meetings—one in Europe and one in the US. In addition, there are special interest groups that meet throughout the year to exchange information on specific subject areas and provide targeted feedback to Perceptive. For us, customers are not just nameless faces; they are part of the close-knit community of biopharmaceutical professionals in a meaningful, long-term partnership with Perceptive.

The IMPACT solution is a key part of Perceptive's leading integrated eClinical Suite. The automated integration with ClinPhone RTSM and DataLabs EDC applications allows users to seamlessly share trial data. Enabled through our unique integration platform, IMPACT users enjoy accurate and timely data without having to duplicate activities. The integration of IMPACT with RTSM and EDC enables your entire organization to benefit from the true power of CTMS.
